Using MR97

Using MR97

MR-97® is a boron nitride ("BN") spray.

When applied to Colour de Verre molds, the results are superior castings, virtually no spurs or sharp edges, and a beautiful, shiny surface. Application is as easy as applying a cooking spray.

The biggest considerations are:

- Application requires a bit of finesse. MR-97 spray contains an ultra-fine powder. One must make sure that the entire surface is thinly, but completely covered.
- Once you start using a BN spray on a mold, you can't go back. The spray seals the mold and traditional primers won't be absorbed evenly.
- We tested MR-97 in firings up to 1440°F (780°C). We noted at higher temperatures, MR-97 worked best with transparent glasses. At these higher temperatures, a cloudiness appeared on opal glasses. We believe this surface cloudiness or veiling might be mitigated by reducing temperatures and, instead, increasing hold times. This cloudiness can also be reduced by mixing opals with at least 50% clear or transparent frits.
- Like all fine particle products, it is important to wear a dust mask. Also, because of the propellents, it is important to apply it and remove it outside or in a well-ventilated space.
- A can of quality BN will give you four to five dozen uses depending on the molds' size.

Applying MR-97

If your mold has been used before, completely remove all the old Primo Primer from the mold with a stiff nylon kitchen brush and/or toothbrush. Read the instructions on the MR-97 can.

Make sure to shake the can thoroughly for at least 30 seconds after you start hearing the ball freely rattling inside the can.

The first time MR-97 is used on a mold, it is necessary to apply two coats of the product. Hold the can 10 to 12 inches from the mold.

Hold both the can and the mold upright.

For smaller, shallow molds, apply the first, light coat using a two to three-second burst of spray in a sweeping pattern across all the mold's cavities. For larger molds – the Colour de verre box molds for example – use a three to five-second blast making sure to cover the deepest recesses.

Do not saturate the surface. Set the mold aside for five minutes so it can dry.

Once dry, reapply a second coat using another two to three-second (three to five-second for larger molds) burst of spray.

Let the mold dry for ten to fifteen minutes. The mold is ready to fill.

Filling the Molds

The MR-97 surface is delicate and care must be taken not to scratch away the primer as you fill the mold. We recommend using powder, fine, and medium frit as opposed to larger meshes or broken sheet glass. The larger frit can scratch the surface and create potential sticking problems.

Cleaning Your Castings

It is important to remove any residual boron nitride from your glass casting otherwise your cast components will not tack fuse properly in your next firing. Wash the casting in warm water with a little dish washing liquid and a mild, abrasive cleansing powder like Bon Ami®. Rinse thoroughly and dry.

Subsequent Firings

The MR-97 becomes powdery after firing and it is best to remove it so that it doesn't mix with frit on the next firing. We strongly suggest doing this outside or in a well ventilated area wearing a dust mask. Use a stiff, nylon kitchen brush and/or toothbrush – the same tools used to remove Primo Primer – to remove the BN powder. The cleaned surface will look burnished and shiny. Reapply *one* thin coat of MR-97 as before. The surface should now look matte. If any areas are still shiny, touch up with a little more spray. Let the mold dry for ten to fifteen minutes before refilling.

Creative ceramic fusing molds

The Creative Ceramics Molds are designed as durable slumping and bending molds for glass. The specially formulated raw materials guarantees the durability even when fired several times a day! The smooth surface accepts the primer uniformly and ensures the glass to glide smoothly during the slumping process.

Application:**1. Check sizes**

The mold are largely made by hand. Small differences in size may be possible. Before cutting the glass, double check the size of the mold.

2. Prefiring:

Prefiring is recommended especially for molds larger than 30cm.

Firing: Fire the kiln in 50°C/h (90°F/h) up to 800°C (1470°F), no holding time.

Cool down the mold in the kiln.

3. Brush or spray the kilnwash on and let it dry for approx. 20min in the kiln at 200°C (400°F)

Make sure vent holes in the molds remain open. Replace kilnwash every 3rd to 4th firing or when needed. (Attention: with bending temperatures hotter than 700°C (1250°F) after every firing!)

4. Place the mold on kiln posts for the slumping process. Distance the heating elements no less than 2-3cm.

5. The molds are susceptible to thermal shock (similar to glass) and should not be heated or cooled too fast (special attention required in side-firing kilns). Example: Mold diameter 40cm, 200°C/h (350°F) in topfiring. 100°C/h (180°F) in side-firing kiln.

Using Instructions Colour de Verre

Colour de Verre, Glas Casting System
Preparing with MR97- Spray:

The Boron- Nitrite- Spray MR97 (art. 3565101/02) is sprayed to the molds surface. For new molds you have to apply a 2-3 second burst of spray to the mold. Let it dry for 5 minutes. Then you apply a second blast of 2-3 second and let it dry for 10 minutes. Now the mold is ready to fill.

If you have used the MR97 on the mold it's enough to apply 1 coating to the surface!

Attention: Once you started using MR97 on your mold, you can't go back. No other shelf primer will be absorbed evenly!

Preparing with wet shelf primer:

Mix 1 part Hotline Primo Primer (art 3565200/01) with 5 parts water very well. Apply 4-5 thin layers with a soft paint-brush. Please stir the Primer with the brush every time before applying. Use a hairdryer to cure every coating. The mould must be completely dried before charging and fusing.

Preparing with MR97- Spray:

The Boron- Nitrite- Spray MR97 is sprayed to the molds surface. For new molds you have to apply a 2-3 second burst of spray to the mold. Let it dry for 5 minutes. Then you apply a second blast of 2-3 second and let it dry for 10 minutes. Now the mold is ready to fill.

If you have used the MR97 on the mold it's enough to apply 1 coating to the surface!

Attention: Once you started using MR97 on your mold, you can't go back. No other shelf primer will be absorbed evenly!

Fusing:

Put the mould on small stilts. Avoid a Thermo Shock by heating not faster than 300°F (150° C) per hour up to an end-temperatur of 1250°F (680° C). The firing and cooling times depend to your used glass, to your kiln and to the thickness of the glass you are working with:

Segment 1: 4h - 680°C, 20 min Soak Time

Segment 2: Skip - 770-790°C, 20-30 min Soak Time

Segment 3: Skip - 520°C, 60-90 min Soak Time

Segment 4: 6h - 370°C,

END

Slumping of Floral Moulds:

Segment 1: 4,5h - 650- 670°C, 10min Soak Time

Segment 2: Skip - 520°C, 90 min Soak Time

Segment 3: 6h - 370°C,

END

Demoulding:

If the mould was prepared well the Casting-Object will unfix of its own volition. If not, please turn the mould and beat it carefully on a thick layer of newsprints.

Using the mould again:

Clean the mould well with a hard paint-brush (a vegetable brush or tooth brush). Do not breathe in the dust – use a mask while cleaning. If you prepare the mould carefully before and after firing and if you take care during the fusing you are able to use it for many castings.

All information are indexes and are without guarantee. Use these procedures at your own risk! You will get the filling weight with every form.
